Version 4.02 Release Notes

You can now plot on a coordinate system the data contained in a table.

You can now copy the data from a table and paste it into *Fathom*, Microsoft Excel, or other programs.

The "Show Labels Automatically For All New Points" setting in Text Preferences now works properly for all points (including transformed images, Selection-Arrow created intersections, and coordinate system origins and unit points.

Tables redraw properly after a row is removed using the minus key from the keyboard.

Pressing a matched object in the Script View during Step-by-Step play now highlights the matched object in the sketch.

Pictures moved from Windows to Macintosh and back can now be copied and pasted to other applications

(Mac) Dashed near-straight arcs are now displayed properly.

(Mac) Selected circle, arc, and polygon interiors no longer obscure labels.

(Mac) Saving files to a file server no longer fails if the user doesn?t have write access to the root volume.

(Mac) Fixed a problem in which networked servers didn?t allow multiple launches of *Sketchpad* in certain situations.

(Windows) Moving or renaming the *Sketchpad* application no longer creates problems when double-clicking in Explorer windows to open sketch files.
